brian.lasky@outlook.com | Topeka, KS | Remote — Open to Relocation

PROFESSIONAL SUMMARY

Senior Site Reliability Engineer and Cloud Architect with 17 years of production operations experience, now specializing in the development of Agentic AI Infrastructure and Autonomous Governance Platforms. Certified in AWS and GCP architecture. Design and deploy event-driven control systems for LLM workloads on Kubernetes, emphasizing fiscal governance, real-time cost enforcement, and autonomous remediation — solving the "token runaway" problem that costs enterprises \$10k+ per incident.

Bring formal incident investigation background (125+ RCAs under DOT regulatory scrutiny) directly applicable to agentic failure modes, cost anomaly detection, and policy-driven incident response. Practitioner discipline in reliability, observability, and policy enforcement developed across safety-critical environments, now applied to preventing uncontrolled costs and enforcing budget guardrails in production AI systems.

Currently building production-grade governance controllers and multi-cloud infrastructure. Pursuing CompTIA Security+ (August 2026).

TECHNICAL SKILLS

Cloud Platforms & Kubernetes

GCP: GKE 1.27+, Workload Identity, Cloud Run, Pub/Sub, Secret Manager

AWS: ECS Fargate, EC2, Lambda, S3, RDS, IAM, CloudWatch

Multi-cloud architecture and cross-cloud AI workload orchestration

Kubernetes (GKE Autopilot): Pod lifecycle, RBAC, admission control, state management

SRE & Infrastructure Reliability

Event-driven autoscaling (KEDA), workload orchestration, cost monitoring

Incident response workflows, RTO/RPO validation, postmortem documentation

SLO/SLA design, uptime and latency monitoring

Kubernetes RBAC design and least-privilege enforcement

Cost attribution, budget enforcement, FinOps-enabled operations

AI Infrastructure & Agentic Systems

LiteLLM: multi-model routing, cost tracking, proxy management

Serverless agent orchestration and event-driven pipeline architecture

Token budgeting, cost attribution, runaway workload detection

Agentic governance patterns: detect → evaluate → enforce → remediate → audit

Fiscal governance and autonomous control planes

Policy & Security Enforcement

Kyverno ClusterPolicy (admission control, policy validation, gate enforcement)
OIDC and Workload Identity Federation (keyless authentication)
Secret management, audit logging, compliance validation
Vulnerability scanning: Trivy, Bandit, Safety
Security-as-code and policy-as-code patterns

Infrastructure & Automation

Terraform: modular IaC, remote state, workspace management
Docker, container orchestration, GitOps patterns
CI/CD pipelines (GitHub Actions), automated testing and security scanning
Bash, Python 3.10+: AsyncIO, automation, event-driven architectures

Observability & Monitoring

CloudWatch, GCP Cloud Monitoring, Prometheus, JSON structured logging
Cost monitoring and budget enforcement systems
Incident detection and response automation

Languages & Tools

Python 3.10+: AsyncIO, httpx, event-driven architectures, telemetry processing
Bash: automation, failover scripting, infrastructure validation
Git, GitHub (Actions, workflows)

CERTIFICATIONS AND LICENSES

Google Professional Cloud Architect | 2026
AWS Solutions Architect – Associate | 2026
CompTIA Security+ | In Progress — Target August 2026
Class A CDL — HazMat Endorsement | TSA Federal Vetting | Active 2018 – 2026

PORTFOLIO PROJECTS

Serverless Agentic Governance Controller | github.com/brianmlasky/serverless-agentic-platform
Production-ready event-driven control system that prevents "token runaway" in LLM applications on GKE by enforcing real-time budget policies and autonomously terminating expensive pods. Solves the \$10k+ per incident cost-shock problem by implementing a five-stage governance model: Detect (token/cost telemetry), Evaluate (budget policy comparison), Enforce (Kyverno admission control + RBAC), Remediate (autonomous pod deletion), Audit (compliance trails).

****Why This Matters:**** Enterprise teams are bleeding money on misconfigured LLM prompts. This system closes the gap between cost detection and pod termination in <100ms—before the bill becomes catastrophic.

Key achievements:

- Sub-100ms response time from cost violation to pod termination (p99 latency)

- Kyverno 1.10.0 ClusterPolicy integration for pre-execution budget gating
- GKE Workload Identity (KSA/GSA binding) — eliminated GCP service account keys
- AsyncIO event loop processing 100+ QPS with production-grade latency monitoring
- >80% test coverage (unit + integration tests, synthetic load testing)
- Least-privilege RBAC: controller limited to governed=true namespaces only
- ConfigMap-based state persistence for restart safety and audit trails
- Comprehensive compliance logging for fiscal governance and cost attribution

Technologies: GKE 1.27+, Python 3.10+, AsyncIO, Kyverno 1.10.0, Kubernetes RBAC, Workload Identity, Docker, GitHub Actions (CI/Lint/Test/Security), Pytest, Trivy, Bandit, Safety, JSON logging, Apache 2.0 licensed

Status: Production Ready | Deployed: January 2025

NorthStar Commerce DR Platform | github.com/brianmlasky/multi-cloud-dr-platform
 Architected and deployed production-grade multi-cloud disaster recovery platform achieving RTO of 0s (target <60s) and RPO of 1s (target <300s) across AWS ECS Fargate and GCP Cloud Run. Implemented automated DNS failover via Route 53, cross-cloud PostgreSQL replication from RDS to Cloud SQL with S3/GCS staging, and environment-aware failover scripting validated through end-to-end simulation. Infrastructure fully managed in Terraform with OIDC keyless authentication throughout.

Key achievements:

- Zero-downtime failover: RTO 0s, RPO 1s across cloud boundaries
- Automated DNS failover (Route 53) with OIDC keyless authentication
- Cross-cloud PostgreSQL replication with staged S3/GCS handoff
- Environment-aware failover validation and end-to-end DR simulation
- Complete Terraform IaC with modular workspace management

Technologies: Terraform, AWS ECS Fargate, GCP Cloud Run, RDS PostgreSQL, Cloud SQL, Route 53, S3, GCS, Python, Bash, Docker

PROFESSIONAL EXPERIENCE

Cloud Infrastructure Engineer / Site Reliability Specialist — Independent Projects
 Self-Directed | February 2026 – Present

Full-time transition into SRE and AI infrastructure engineering. Architected and deployed production-ready Serverless Agentic Governance Controller solving real-world token runaway costs (\$10k+ per incident) in LLM workloads on GKE. Completed NorthStar Commerce DR Platform achieving 0s RTO and 1s RPO across AWS and GCP. Building production-grade infrastructure with emphasis on reliability, observability, and automated cost governance.

Key accomplishments:

- Designed and deployed Serverless Agentic Governance Controller on GKE 1.27+ with event-driven AsyncIO architecture achieving sub-100ms remediation latency

— solving \$10k+ token runaway cost incidents

- Architected Kyverno 1.10.0 ClusterPolicy admission control for pre-execution budget policy enforcement on LLM workloads; implements policy-as-code for fiscal governance
- Implemented GKE Workload Identity (KSA/GSA binding) eliminating long-lived GCP service account keys; designed least-privilege RBAC across namespaces (governed=true label enforcement)
- Built five-stage governance model (Detect→Evaluate→Enforce→Remediate→Audit) with ConfigMap state persistence and comprehensive audit trails for cost attribution and compliance
- Engineered Python AsyncIO event loop processing 100+ QPS with sub-p99 latency and >80% test coverage (unit/integration/synthetic load tests)
- Secured entire supply chain: integrated Trivy, Bandit, Safety into GitHub Actions CI/CD pipeline with automated vulnerability scanning and policy checks
- Architected and deployed NorthStar Commerce DR Platform achieving 0s RTO and 1s RPO across AWS ECS Fargate and GCP Cloud Run with automated DNS failover and OIDC keyless authentication
- Authored production-grade Terraform IaC managing full infrastructure lifecycle across both cloud providers with modular workspaces and remote state

Quality Assurance Technician

The Onyx Collection | Belvue, KS | January 2020 – February 2026

Manufacturing QA role with direct accountability for product standards enforcement, defect identification, and compliance documentation in an active production environment. Applied root cause analysis discipline and systematic process validation—foundational to SRE culture and incident response methodology.

- Identified and documented product defects against engineering specifications, enforcing zero-tolerance quality standards on active production lines
- Applied root cause analysis to recurring defect patterns, driving upstream process corrections and reducing repeat defect occurrence
- Developed systematic inspection protocols that increased defect detection rates at source—methodology directly applicable to cloud incident detection
- Maintained audit-ready documentation supporting regulatory and customer quality requirements

Wireline Operator / Downhole Motor Technician

Oil Well Perforators / Halliburton Sperry Drilling | September 2018 – January 2020

Operated wireline and downhole motor systems in high-pressure oilfield environments under federal regulatory oversight. Accountable for equipment reliability, crew safety, and operational execution in remote deployments with zero margin for unplanned downtime—directly analogous to SRE responsibility for production system availability.

- Operated and maintained safety-critical downhole wireline and motor systems across extended field deployments with zero tolerance for failure
- Supported equipment failure investigations and contributed field-level observations to formal RCA processes
- Coordinated multi-crew operations under time-critical well completion schedules—experience directly applicable to incident command and response
- Enforced HazMat handling and transport protocols under federal CDL and TSA requirements

Equipment Operator — Wireline / Cementing / Frac

Patriot Well Solutions | Casper, WY | October 2014 – September 2017

Operated high-pressure well service equipment across wireline, cementing, and hydraulic fracturing operations. Responsible for equipment integrity, job execution, and field-level safety compliance in active oilfield environments.

- Executed well completion operations under strict safety and regulatory protocols
- Maintained and inspected high-pressure equipment to manufacturer and regulatory standards
- Supported incident investigations and contributed field-level observations to formal RCA processes
- Operated under HazMat and DOT compliance requirements throughout all transport and field operations

Field Supervisor

MST / Atlantic Express | Los Angeles, CA | July 2007 – August 2014

Supervised field operations and personnel in a regulated federal transportation environment. Responsible for compliance, scheduling, and operational performance across assigned routes and crews. Built formal incident investigation methodology (125+ RCAs) that translates directly to cloud incident response, postmortem culture, and reliability engineering.

- Investigated and documented 125+ accidents and incidents under federal DOT regulatory frameworks, producing formal written reports with findings, contributing factors, and corrective actions

- Built structured incident investigation methodology directly applicable to cloud incident response, blameless postmortem culture, and reliability engineering practices
- Supervised daily field operations and ensured regulatory compliance across assigned personnel
- Managed scheduling, route coordination, and real-time operational adjustments

EDUCATION

Butler Community College | El Dorado, KS | (In Progress — Target Aug 2026)

Franciscan University of Steubenville | Steubenville, OH | Attended 2003 – 2007
